                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cucumber expansin-29 (AAR94527) is a member of a novel class of proteins that catalyse the extension of plant cell walls and the weakening of the hydrogen bonds in pure cellulose. It can be obtd. by expression of an isolated cDNA clone (see AAT13320) in bacterial or other host cells. Expansin proteins have also been identified in oat coleoptiles, in Arabidopsis (see AAR94530-32) and in rice (AAR94528-29), and appear to be broadly distributed throughout the plant kingdom. Expansins can be used e.g. in the mfr., de-inking and recycling of paper, in the textile industry, to aid delignification processes, to alter gel mechanical strength, etc.

                                                                                                   Expansins are a novel class of proteins that catalyse the extension of plant cell walls and the weakening of the hydrogen bonds in pure cellulose. 2 Expansins (AAR94528 and AAR94529) have been identified rice and 3 in Arabidopsis (AAR94530-32). A cDNA clone (AAR13320) coding for cucumber expansin 29 (AAR94527) has been obtd. Expansins can be used e.g. in the mfr., de-inking and recycling of paper, in the textile industry, to aid delignification processes, to alter gel

Sol-Church K., Frenck J., Troeber D., Mason R.W.;
"Cloning of a mouse cysteine protease.";
Submitted (JUN-1999) to the EMBL/GenBank/DDBJ databases.
-!- SUBCELLULAR LOCATION: Lysosomal (Potential).
-!- TISSUE SPECIFICITY: EXPRESSED IN PLACENTA.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY C1; ALSO KNOWN AS THE PAPAIN FAMILY OF THIOL PROTEASES.
                                                                                                                                                                                                                                                        CHAIN

-! CATALYTIC ACTIVITY: Release of an N-terminal dipeptide, Xaa-Xbb-(-XCC, except when Xaa is Arg or Lys, or Xbb or XCC is Pro.
-!- SUBUNIT: DIMER OF AN ALPHA CHAIN AND A BETA CHAIN CROSS-LINKED BY A DISULFIDE BOND.
-!- SUBCELLULAR LOCATION: Lysosomal.
-!- TISSUE SPECIFICITY: BROADLY DISTRIBUTED, BUT HIGHER LEVELS FOUND
